

--Abstract

61
In an interactive computer controlled display system with speech command input recognition and visual feedback, implementations are provided for predetermining a plurality of speech commands for respectively initiating each of a corresponding plurality of system actions in combination with implementations for providing for each of said plurality of commands, an associated set of speech terms, each term having relevance to its associated command. Also included are implementations for detecting speech command and speech terms. The system provides an implementation responsive to a detected speech command for displaying said command, and an implementation responsive to a detected speech term having relevance to one of said commands for displaying the relevant command. The system further comprehends an interactive implementation for selecting a displayed command to thereby initiate a system action; this selecting implementation is preferably through a speech command input. The system preferably displays the basic speech commands simultaneously along with the relevant commands.--

IN THE CLAIMS:

Please amend the claims as follows.
